

ABSTRACT OF THE DISCLOSURE

5 A moveable headrest is mounted on or with respect to
a support for supporting a user in viewing images in a
standing, seated, or reclining posture. The headrest is
for supporting the head of the user in executing head
movements with a changing direction-of-view. A display
mounted with respect to the user's head provides the
images. An actuator can be provided for moving the
moveable headrest for a passive user. A sensor can be
10 provided for sensing movements of the moveable headrest,
i.e., for sensing said movements from a changing
direction. The moveable headrest apparatus may include
either or both the actuator and the sensor.
